El Parasaurolophus

El Parasaurolophus existió aproximadamente hace 75 millones de años en el Canadá y los Estados Unidos. Alcanzó una longitud de aproximadamente 10 m y tenía una inhabitual cola gruesa. Los científicos creen que estos dinosaurios tenían colores brillantes en la cola a fin de hacerse señales unos a otros. Algunos de estos dinosaurios tenían hasta 2.000 dientes. El Parasaurolophus tenía una enorme cresta hueca en la cabeza, similar al colmillo de un elefante. La cresta era de casi 1,8 m de longitud, de tamaño de un hombre alto.

Los científicos han tratado de soplar aire dentro de tubos huecos moldeados en forma de dichas crestas y cada uno produjo un sonido diferente. Se presume que estos dinosaurios las usaban como medio de comunicación cuando se desplazaban en manadas.

¿Podríamos imaginarnos cómo habrán sido las llanuras y bosques de Alberta, Utah y Nuevo México hace 75 millones de años con estos dinosaurios de colores brillantes por doquier emitiendo sonidos raros con sus crestas?

Parasaurolophus

Parasaurolophus lived approximately 75 million years ago in Canada and the United States. It grew to about 10 m (33 ft) in length and had an unusually thick tail. Scientists believe that these dinosaurs had bright colors on their tails, in order to signal each other. Some of these dinosaurs had as many as 2000 teeth. Parasaurolophus had an enormous hollow crest on its head, similar to an elephant tusk. The crest was almost 1.8 m (6 ft) long. That is as large as a tall man.

Scientists have tried blowing air into hollow tubes shaped like their crest, and each tube made a different sound. It is assumed that they used them as a method of communication, while traveling in herds.

Can you imagine what the plains and forests of Alberta, Utah and New Mexico must have looked like 75 million years ago with all these bright-colored dinosaurs wandering around making funny noises with their crests?

Parasaurolofo

Il parasaurolofo viveva circa 75 milioni di anni fa in Canada e negli Stati Uniti. Arrivava a circa 10 metri di lunghezza ed aveva una coda eccezionalmente spessa. Gli scienziati credono che i colori brillanti della coda servissero a comunicare con altri dinosauri della sua specie. Questo dinosauro poteva avere fino a 2000 denti. Il parasaurolofo portava in testa un'enorme cresta cava, simile alla zanna di un elefante. La cresta era lunga circa 1,80 metri, cioè pari a un'uomo di alta statura.

Gli scienziati hanno provato a soffiare aria in tubi cavi di forma simile a queste zanne e ciascuna ha emesso un suono diverso. Si crede che la cresta fosse usata come mezzo di comunicazione, quando i dinosauri si spostavano con il branco.

Potete immaginare la vista che presentavano le pianure e le foreste del territorio dell'Alberta, e degli stati dell'Utah e del Nuovo Messico 75 milioni di anni fa, con i loro dinosauri dai colori vivacissimi che le popolavano e che emettevano strani suoni con la loro cresta?

Le Parasaurolophus

Le Parasaurolophus vivait au Canada et aux États-Unis il y a environ 75 millions d'années. Il mesurait environ 10 mètres de long et avait une queue extrêmement épaisse. Les savants croient que cette queue était de couleurs vives, servant aux Parasaurolophus à se faire des signaux entre eux. Certains de ces dinosaures avaient jusqu'à 2 000 dents! Le Parasaurolophus avait une énorme crête creuse sur la tête, semblable à une défense d'éléphant. Cette crête mesurait presque 1,80 m de long, c'est-à-dire autant qu'un homme de grande taille.

Des savants ont essayé de souffler de l'air dans des tubes creux ayant la même forme que cette crête et chaque tube avait un son différent. On suppose que les Parasaurolophus s'en servaient pour communiquer, quand ils se déplaçaient en troupeaux.

Pouvez-vous imaginer à quoi devaient ressembler les plaines et les forêts de l'Alberta, de l'Utah et du Nouveau-Mexique il y a 75 millions d'années, quand tous ces dinosaures aux couleurs vives se déplaçaient en émettant de drôles de sons avec leurs crêtes?

Parasaurolophus

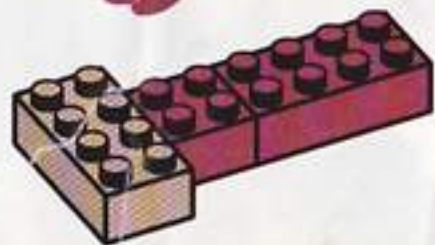

Der Parasaurolophus lebte vor ungefähr 75 Millionen Jahren in Kanada und den Vereinigten Staaten. Er wurde ungefähr 10 m lang und hatte einen ungewöhnlich dicken Schwanz. Wissenschaftler nehmen an, daß diese Dinosaurier bunt gefärbte Schwänze hatten, um sich gegenseitig zu verständigen. Einige dieser Dinosaurier hatten bis zu 2.000 Zähne. Der Parasaurolophus hatte ein riesiges hohles Horn auf seinem Kopf, ähnlich wie der Stobzahn eines Elefanten. Dieses Horn war ungefähr 1,8 m lang. Das ist die gleiche Größe wie ein großer Mann.

Wissenschaftler haben versucht, Luft in Röhren zu blasen, die ähnlich wie diese Hörner geformt sind. Jede Röhre brachte einen anderen Ton hervor. Es wird angenommen, daß sie von den Dinosauriern, während sie sich in Herden fortbewegten, als Verständigungsmittel benutzt wurden.

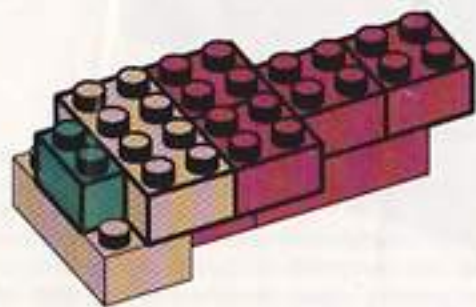

Kannst Du Dir vorstellen, wie die Prärien und Wälder von Alberta, Utah und Neu-Mexiko vor 75 Millionen Jahren mit all diesen bunt gefärbten Dinosauriern, die umherwanderten und seltsame Geräusche mit ihren Hörnern machten, ausgesehen haben müssen?
